

SYSTEM AND METHOD FOR GLOBALLY AND SECURELY ACCESSING
UNIFIED INFORMATION IN A COMPUTER NETWORK

ABSTRACT OF THE DISCLOSURE

5 A client stores a first set of workspace data, and is coupled via a computer network to a global server. The client may be configured to synchronize portions of the first set of workspace data with the global server, which stores independently modifiable copies of the portions. The global server may also store workspace data which is not downloaded from the client, and thus stores a second set of workspace data. The global
10 server may be configured to identify and authenticate a user seeking global server access from a remote terminal, and is configured to provide access to the first set or to the second set. Further, services may be stored anywhere in the computer network. The global server may be configured to provide the user with access to the services. The system may further include a synchronization-start module at the client site (which may
15 be protected by a firewall) that initiates interconnection and synchronization with the global server when predetermined criteria have been satisfied.
